Data sheet

## 2- and 3-way control valves <br> VRBZ

## Description / Application

* Closing plug and closing nut as accessories only.

VRBZ control valves provide a quality, cost effective solution for most low pressure and hot water applications where threaded connections up to 40 mm are required. The red bronze body and brass plug are suitable for pressures up to 16 bar and the 5.5 mm stroke length gives good rangebility. Valves comply with PED directive 97/23/EC.

## Main data:

- Red bronze construction.
- Thread nipples:
- Internal Rp $3 / 4$ " - $11 / 2$ "
- External G 1¼" - $\mathbf{2}^{1 / 4} 4^{\prime \prime}$
- Suitable for water temperatures from 2 to $120^{\circ} \mathrm{C}$.
- Nominal operating pressure: 16 bar max.
- Suitable for use with AMV(E) 01/02 and AMV(E) $13-\mathrm{SU}$ and $\operatorname{AMV}(E) 13$ actuators.

Pressure temperature diagram

NOTE:
$\mathrm{k}_{\mathrm{vs}}$ - is the flow in $\mathrm{m}^{3} / \mathrm{h}$ of water at a temperature between $5^{\circ} \mathrm{C}$ and $40^{\circ} \mathrm{C}$ which passes through a valve open at the nominal stroke with 100 kPa (1 bar) pressure drop.

Max. $\Delta \mathrm{p}$ is the physical limit of differential pressure the valve will close against. Max. $\Delta \mathrm{p}$ is in this case also recommended maximum $\Delta \mathrm{p}$ which is based on generation of noise, plug erosion, etc. It should be checked against the $\Delta \mathrm{p}$ figure calculated from the chart on page 4 or the equation below, with the valve fully opened at the designed flow rate.
$\Delta P_{\text {valve }}=S\left(\frac{Q}{k_{v s}}\right)^{2}$
where:
$\mathrm{S}=$ specific gravity
$Q=$ flow rate in $\mathrm{m}^{3} / \mathrm{h}$
$\Delta P_{\text {valve }}=$ pressure drop across valve in bar (fully open)

## Conversion factors

$1 \mathrm{bar}=100 \mathrm{kPa}=14.5 \mathrm{psi}$
$1 \mathrm{l} / \mathrm{s}=1 \mathrm{~kg} / \mathrm{s}=3.6 \mathrm{~m}^{3} / \mathrm{h}$

## Design

## Disposal

The valve must be dismantled and the elements sorted into various material groups before disposal.

## Data sheet

## 2- and 3-way control valves VRBZ

## Installation

## Hydraulic connections

Mount according to flow direction as indicated on valve body, $A B$ is always the outlet port; inlets are A (two port) or A and B (three port).

## Valve mounting

Before mounting the valve be sure that the pipes are clean and free from swarf. It is essential that the pipes are lined up squarely with the valve at each connection and are free from vibrations.

Install the motorized control valves with the actuator in a vertical or horizontal position but not upside down.

Leave sufficient clearance to facilitate the dismantling of the actuator from the valve body for maintenance purposes.

The valve must not be installed in an explosive atmosphere or at an ambient temperature higher than $50^{\circ} \mathrm{C}$ or lower than $2^{\circ} \mathrm{C}$. It must not be subject to steam jets, water jets or dripping liquid.

Note that the actuator may be rotated up to $360^{\circ}$ with respect to the valve body, by loosening the retaining fixture. After this operation retighten.

Hydraulic diagrams for applications of 3-way mixing valves
Note the valve must only be used as a mixing valve, and is not suitable for diverting (with one inlet and two outlet ports). Where this function is required, the valve should be arranged in the return line, as Fig. 2.

Note that if the pump is installed before the $A$ port of the valve arrangement (fig.1, fig 2), then excessive valve hammering will occur thus resulting in an overload of the actuator.

Fig 1 Mixing valve used in mixing application.

Fig 2 Mixing valve used in diverting application.

## Control valves sizing diagram for fluids

## Control valves sizing diagram for fluids (continued)

## Example:

## 1 For fluids with specific gravity of 1 (e.g. water) <br> Design data: <br> Flow rate: $6 \mathrm{~m}^{3} / \mathrm{h}$ <br> System pressure drop: 55 kPa

Locate the horizontal line representing a flow rate of $6 \mathrm{~m}^{3} / \mathrm{h}$ (line A-A). The valve authority is given by the equation:

Valve authority, $a=\frac{\Delta P 1}{\Delta P 1+\Delta P 2}$
Where:
$\Delta \mathrm{P} 1=$ pressure drop across the fully open valve, $\Delta \mathrm{P} 2=$ pressure drop across the rest of the circuit with a fully open valve

The ideal valve would give a pressure drop equal to the system pressure drop (ie. an authority of 0.5 );
If $\Delta \mathrm{P} 1=\Delta \mathrm{P} 2$
$\mathrm{a}=\Delta \mathrm{P} 1 / 2^{*} \Delta \mathrm{P} 1=0.5$
In this example an authority of 0.5 would be given by a valve having a pressure drop of 55 kPa at that flow rate (point B). The intersection of line A-A with a vertical line drawn from B lies between two diagonal lines; this means that no ideally-sized valve is available. The intersection of line A-A with the diagonal lines gives the pressure drops stated by real, rather than ideal, valves. In this case, a valve with kvs 6.3 would give a pressure drop of 90.7 kPa (point C ):
hence valve authority $=\frac{90.7}{90.7+55}=0.62$

The second-largest valve, with kvs 10, would give a pressure drop of 36 kPa (point D):
hence valve authority $=\frac{36}{36+55}=0.395$
Generally, for a 3 port application, the smaller valve would be selected (resulting in a valve authority higher than 0.5 and therefore improved controlability). However, this will increase the total pressure and should be checked by the system designer for compatibility with available pump head, etc. The ideal authority is 0.5 with a preferred range of between 0.4 and 0.7 .

## 2 For fluids with specific gravity different from 1 <br> Design data: <br> Flow rate: $6 \mathrm{~m}^{3} / \mathrm{h}$ of fluid, S.G. 0.9 <br> System pressure drop: 10 kPa

For this example, the left hand axis of the diagram must be ignored. Starting from the RH axis, the flow rate of $6 \mathrm{~m}^{3} / \mathrm{h}$ is located (point E ). The intersection of the diagonal line from point $E$ with a vertical line from S.G. $=0.9$ gives the starting point for the effective flow rate line F-F. The process then continues as for Example 1, so 10 kPa intersects F-F nearest to the kvs 16 diagonal. The intersection of F-F with kvs 16 gives a valve pressure drop of 12.7 kPa (point G).
